

REVEG BERM

WHAT IS IT?

The Reveg Berm, is an environmentally friendly alternative to standard silt fencing. This erosion and sediment control technique utilises recycled organics and binder therefore eliminating the need for plastics or any additional reinforcement.

HOW DOES IT WORK?

Reveg Berms are placed on level contours, which help dissipate water flow in order to reduce sediment transport. This particular technique is highly effective at trapping and filtering fine particles reducing the risk of contaminant / sediment release.

Inset: Construction of Reveg Berm

'Being 100% organic, the Reveg Berm provides easy and low cost installation'.

WHAT ARE THE KEY BENEFITS?

- Easy and low cost installation compared to standard silt fencing;
- Low impact technique that provides great value for money;
- Withstands high winds and UV rays;
- Reduces sediment run-off as the flow is filtered and dispersed;
- Does not require trenching, additional reinforcement or removal; and
- Can be seeded for permanent sites or recycled and used on other sites.
